17 – 20 Jul 2018

Improving Force Design Force Structure Review

Force Structure Review (FSR) process:

- Senior leadership applying **military judgement** over force options through seminar wargaming

Complexity of modern ops → difficult to **rely on intuition** for Force Design

- Many factors affect modern ops
- Difficulty in assessing impact of new capability (yet to be developed)
- Future wars fought differently to past

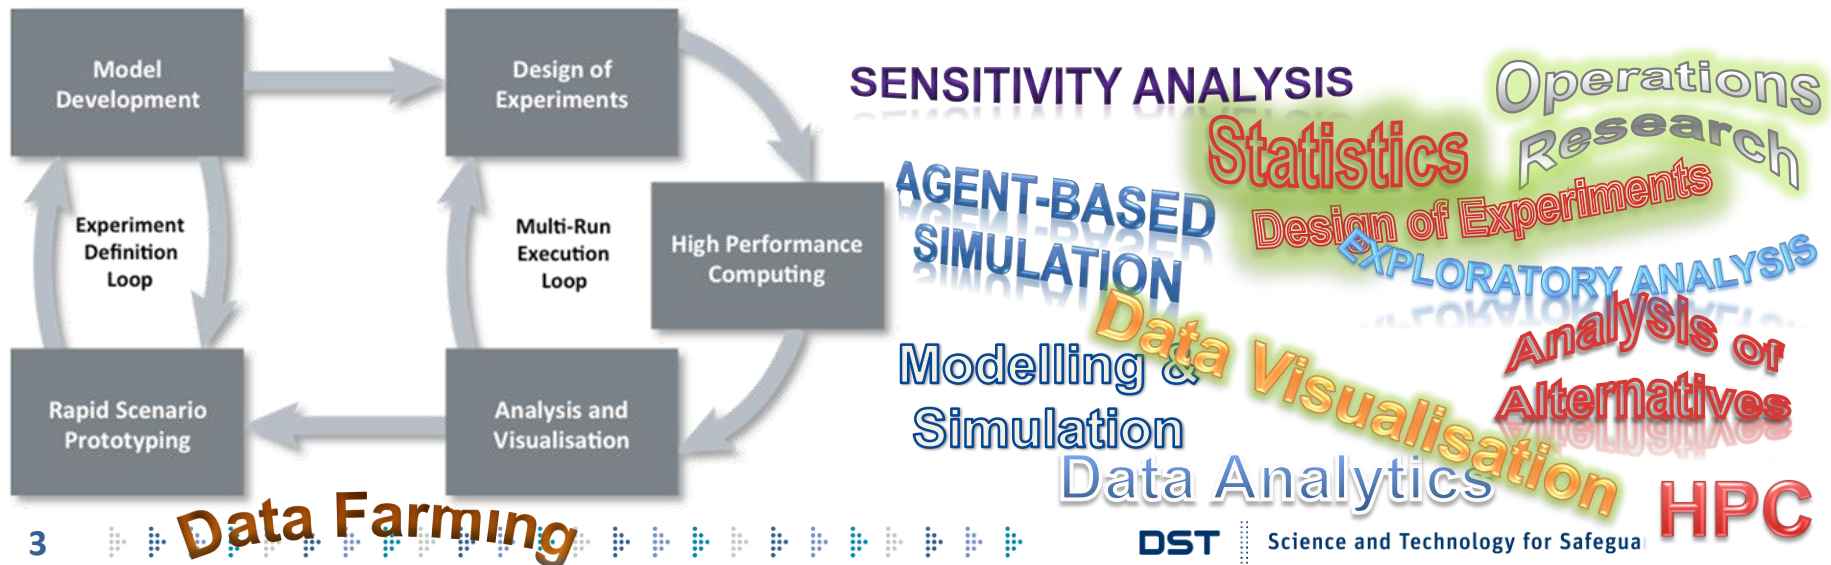

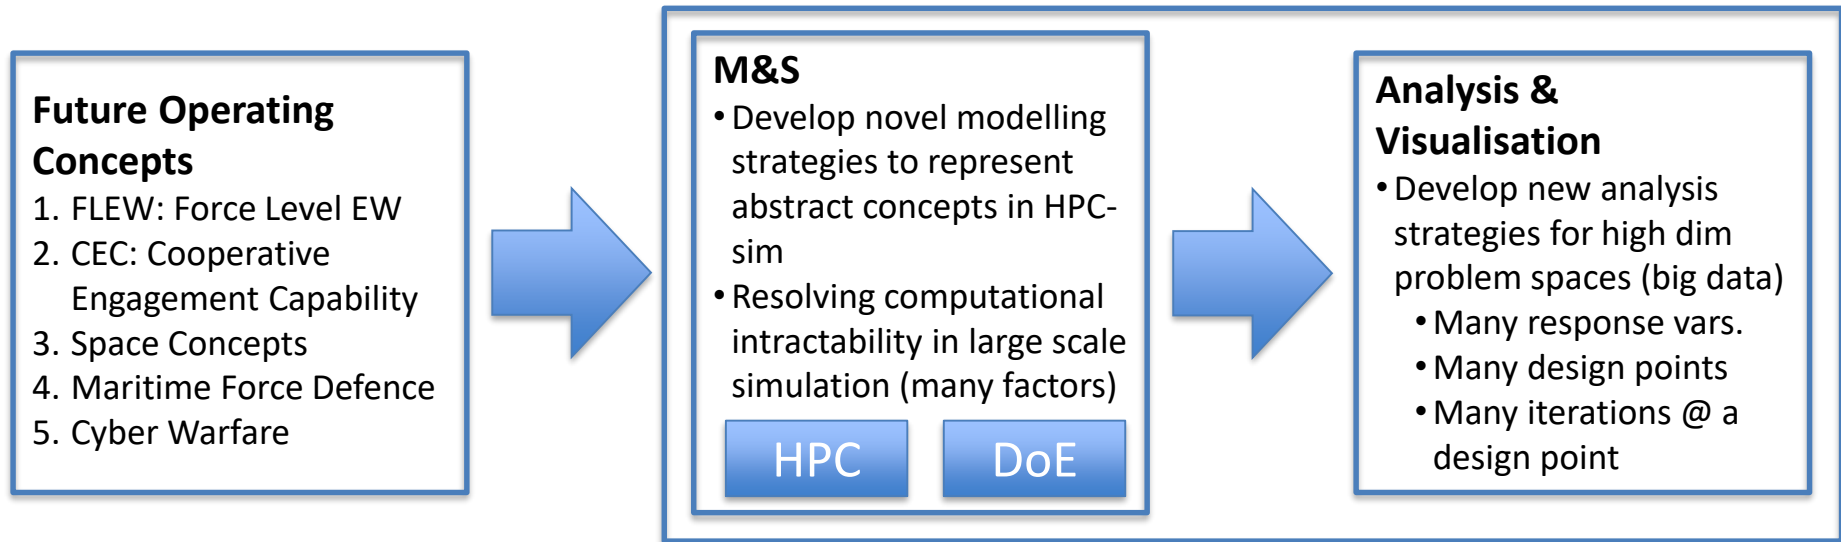

SR2 will deliver a sim capability for exploring & developing complex **whole-of-force** operating concepts

Operating Concepts for Exploration

- Force Level Electronic Warfare
- Maritime Force Defence
- Space Concepts
- Cooperative Engagement
- Information Age Combat Model
- Cyber Warfare
- New Operating Concepts

Involved Methods & Fields of Study

JFOrCE: Joint Future OpeRating Concept Explorer

Whole-of-force **agent-based** sim supporting analysis of future operating concepts

JFOrCE:

- **NetLogo**
- Blue & Red forces

Platform Capabilities:

- Fast jets, AEW&Cs
- Light & heavy armoured vehicles, GBADs
- Submarines, destroyers

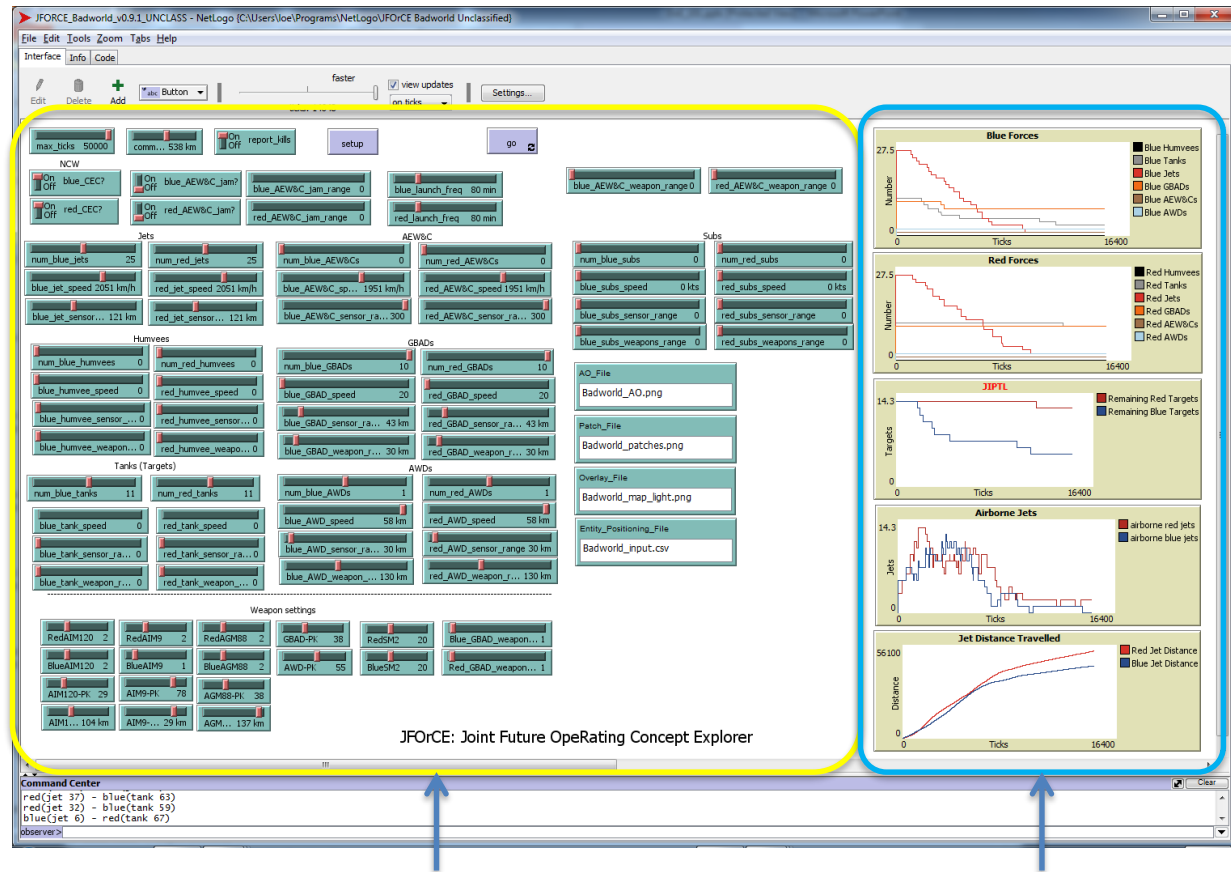

System Capabilities:

- Electronic Warfare jamming
- Cooperative engagement
- Network connectivity

Platforms characterised by:

- Numbers of assets
- Sensor range
- Weapons range

Run sim-experiments to observe impact of **factors** on system **responses**

Factors

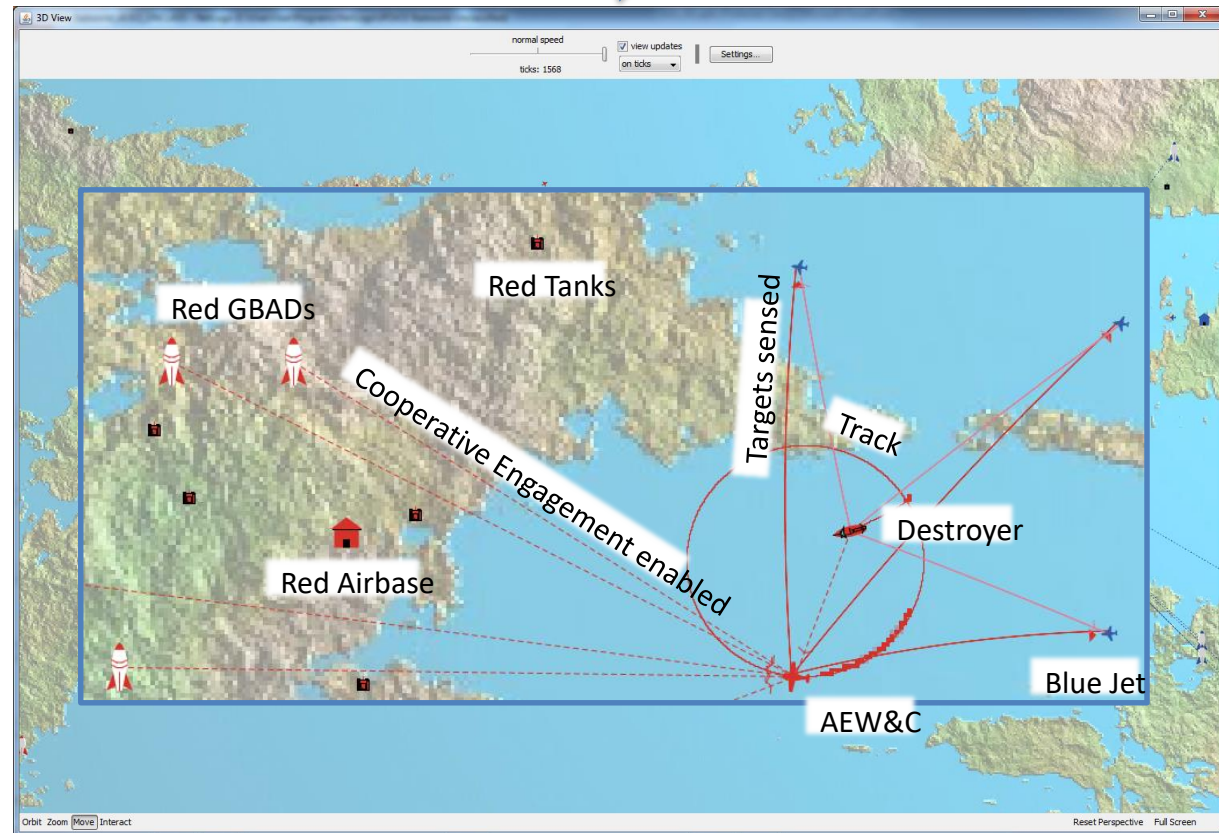

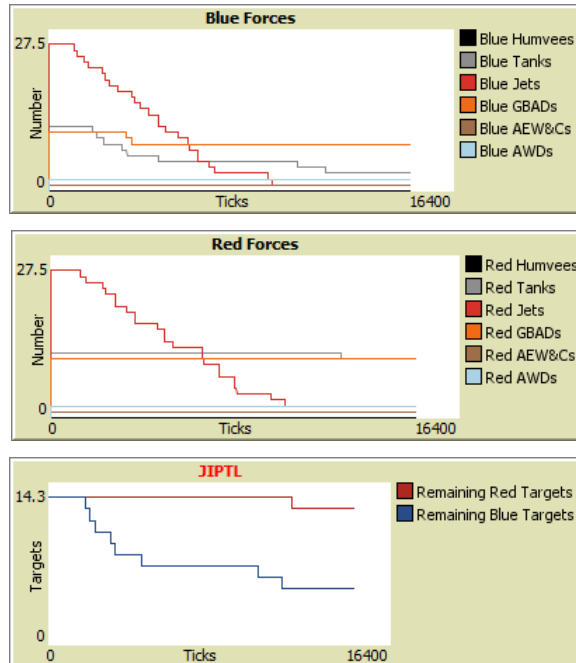

Responses

JFOrCE: Joint Future OpeRating Concept Explorer

Sim Visualisation

- Agents undertake missions
- **Sense** environment & **react**

Assess impacts on MoEs

Simulation results contribute experiment data at a **design point** (a specific force structure)

Behaviour Space: Experiment Designs

Configuring design points for simulation experiments:

- Specific or range of IVs:
 - ["slider1" v_k]
 - ["slider2" v_1 v_2 ... v_n]
 - ["slider3" [v_{min} δ v_{max}]]
- # **reps** at a design point
- Identify DVs to report on

NetLogo headless-mode

- Running without GUI
- Support: Data farming

Only Full-Factorial designs

Experiment

Experiment name:

Vary variables as follows (note brackets and quotation marks):

```
[["num_blue_jets" 5 10 15 20]
["blue_jet_speed" [1000 500 2500]]
["blue_jet_sensor_range" [50 50 250]]
["num_red_jets" 5 10 15 20]
["red_jet_speed" [1000 500 2500]]]
```

Either list values to use, for example:
 ["my-slider" 1 2 7 8]
 or specify start, increment, and end, for example:
 ["my-slider" [0 1 10]] (note additional brackets)
 to go from 0, 1 at a time, to 10.
 You may also vary max-pixcor, min-pixcor, max-pycor, min-pycor, random-seed.

Repetitions:
 run each combination this many times

☒ Run combinations in sequential order

For example, having ["var" 1 2 3] with 2 repetitions, the experiments' "var" values will be:
 sequential order: 1, 1, 2, 2, 3, 3
 alternating order: 1, 2, 3, 1, 2, 3

Measure runs using these reporters:

```
count humvees with [color = blue]
count tanks with [color = blue]
count jets with [color = blue]
count GBADs with [color = blue]
count AEW&Cs with [color = blue]
```

one reporter per line; you may not split a reporter across multiple lines

☒ Measure runs at every step

if unchecked, runs are measured only when they are over

Setup commands:

Go commands:

☐ Stop condition:
the run stops if this reporter becomes true

☐ Final commands:
run at the end of each run

Time limit:
 stop after this many steps (0 = no limit)

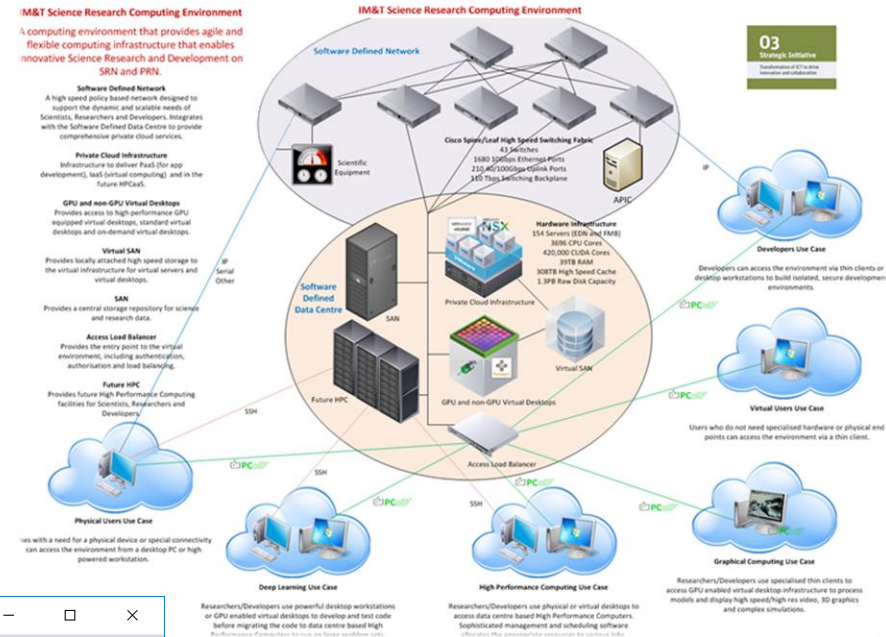

Web Services supporting NetLogo DF as a Service

NATO MSG-155: investigating Data Farming **as a Service**

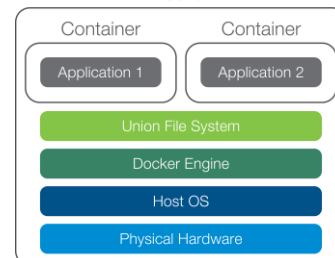

DST is acquiring PC Clusters & **High Performance Computing**

Proof of concept: **demo NetLogo data farming as a Web Service**

Open up HPC functionality for **data farming**

Docker

Coalition Networks
SOAP / HTTP

NetLogo
DFS Web
Service

HPC

DB

Under the Bonnet

Server Execution: NetLogo-Headless

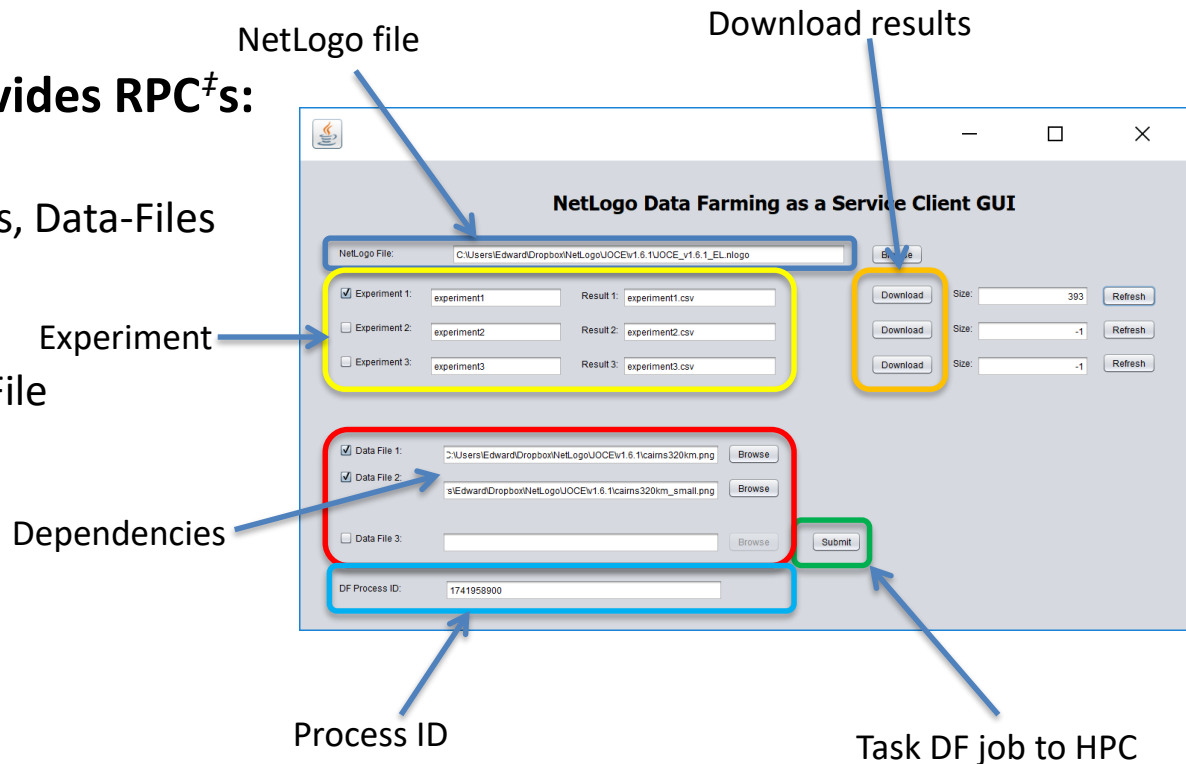

- No GUI, command-line invocation
- Run DF simulation experiments & output results to a CSV file
- Results file remains undeleted

Net Logo Web Service Client

- GUI: connect to HPC backend
- WS client stubs automatically generated from WSDL† file

NetLogo Web Service provides RPC[‡]s:

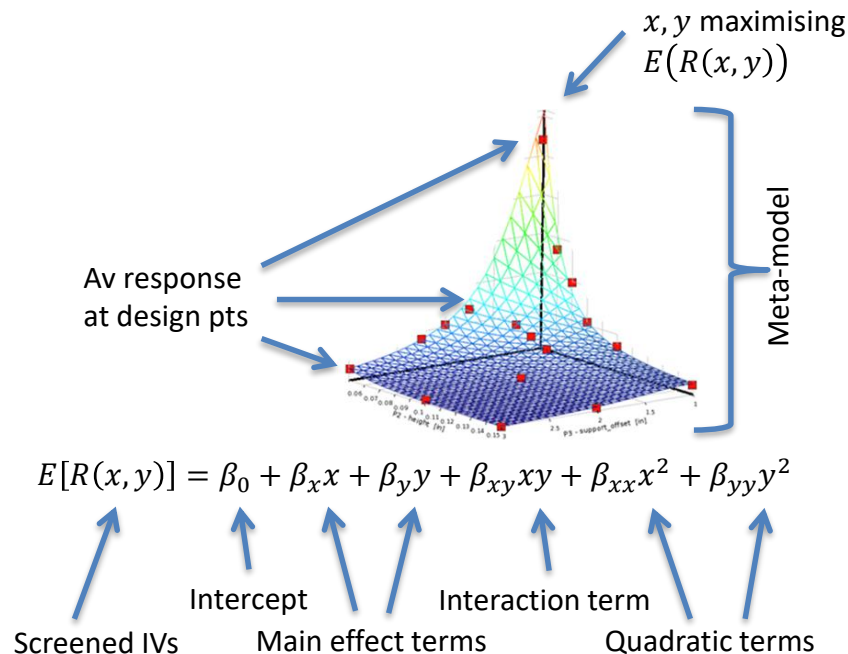

- Run-Model
 - In: Model, Experiments, Data-Files
 - Out: Process-ID
- Get-Result-Size
 - In: Process-ID, Result-File
 - Out: File-Size
- Download-Result
 - In: Process-ID
 - Out: Result-File

DASE: Design & Analysis of Sim Experiments

How to run massive numbers of sim runs on HPC by brute-force?

- Not always necessary!
- DASE to the rescue:
 - Decides on choosing combos of IVs
 - Strategies for analysis of results

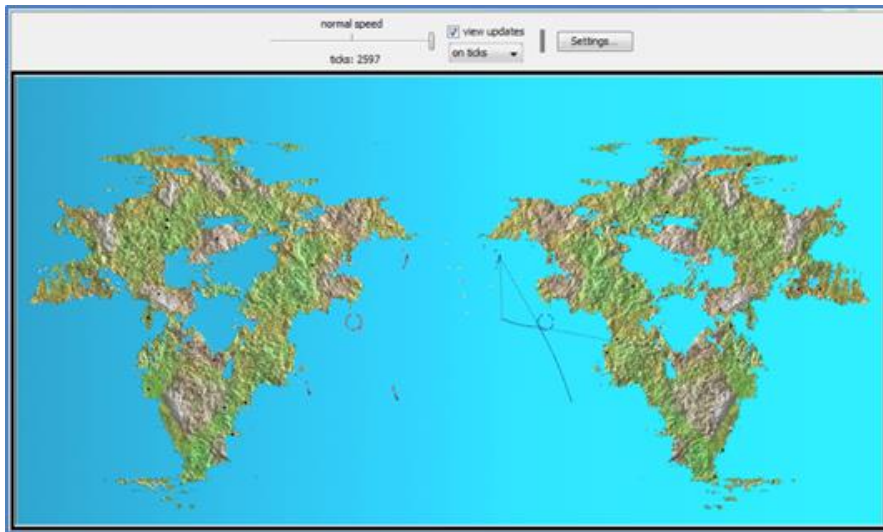

Experiment Objective:

- **Screening**: cull IVs with negligible influence on sim response
- **Sensitivity Analysis**: fit meta models to characterise influential IVs
- **Optimisation**: IV settings for max response
- **Analysis of Alternatives**:
 - Ranking (best to worse)
 - SSCB: Select Subset Containing Best
 - SotB: Selection of the Best

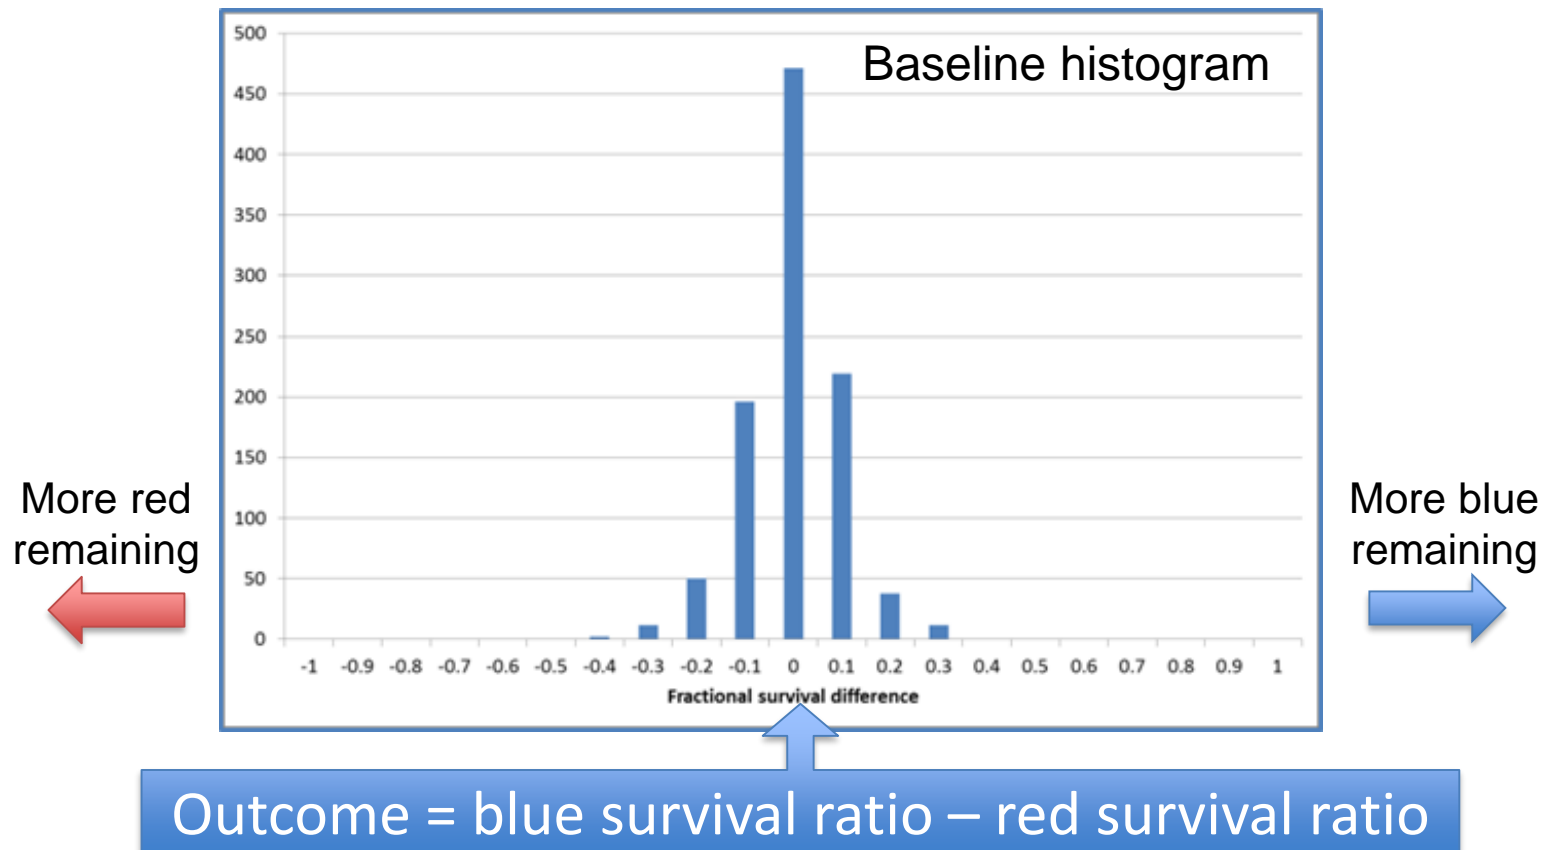

Example: Evaluate Information or Force Advantage

- Aim: measure how advantages in force or info influence chance of winning
- Fictitious geographically symmetrical scenario
- Baseline: 72 jets, 8 GBADs, 1 AWD, 1 AEW&C, 12 vehicles
- Force advantage: having more firepower than opponent, 4 more jets, 2 more GBADs, or 2 more AWDs
- Info advantage: AEW&C capable of sharing sensor info with GBADs & AWDs for target execution (afforded by CEC)

Measure of Effectiveness (MOE)

- Offensive MOE: fraction of red killed after run
- Defensive MOE: fraction of blue surviving after run
- Winning side is one having higher fraction of force surviving after run

Influence of Force and/or Info Advantage

<i>Blue Information Advantage</i>	<i>Blue Force Advantage</i>			
	Like force	More jets	More GBADs	More AWDs
No	0.36	0.42	0.47	0.66
Yes	0.57	0.58	0.58	0.73

Blue's force advantage:

- Tendency to win
- Order of improvement: more jets, more GBADs, more AWDs
- Remarkable strength with more AWDs

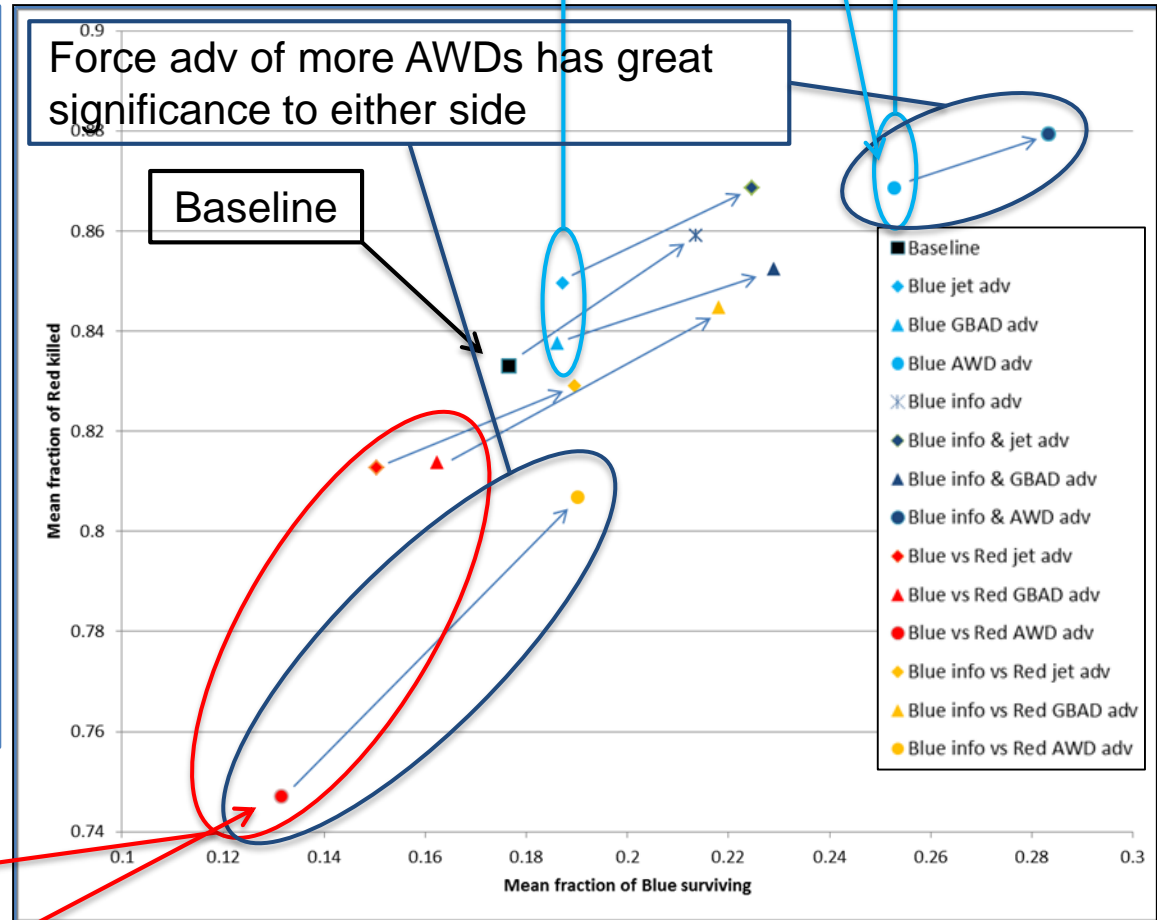

Blue's info + force advantage:

- Info adv dominating as force multiplier
- More jets/GBADs made not much difference to info only
- Info + more AWDs sufficient to magnify tendency to win

Offensive Power vs Defensive Power

Best outcome for Blue, further intensified with info adv

- X-axis: Defensive power = fraction of Blue surviving [0, 1]
- Y-axis: Offensive power = fraction of Red killed [0, 1]
- Blue dominate conflict if positioned in upper right corner
- Increasing info or force adv enhances combat effectiveness
- All arrows pointing towards top right corner
- Sharing sensor info with air warfare assets amplified both defensive & offensive power

Red's force adv suppress
Blue's combat power
Worst outcome for Blue,
alleviated by info adv

Arrows indicating effects of info advantage

Summary

- Agent based simulation can **compare relative worth** of combat units in terms of **operational effectiveness**
- Analysis using JFOrCE can gain **quantitative insight** on info or force advantage
- Info advantage has marked payoff, tend to multiply any additional combat capability in terms of defensive & offensive power
- **Force design supported by combat simulation** can provide refined statements of requirement, preliminary trade-off analyses, & improved cost benefit analyses
- Future Work:
 - Develop **broad types of capability** for force advantage with wide range of parameters
 - Explore implications of **future operating concepts** – FLEW, IAMD, CEC, & cyber
 - Employ methods for **design of experiments** to support data farming
